

STAT573 Week 2 - Spotify Group Summary

Megan Millet, Gbenga Solomon, Carson Vrba, Priscilla Yinzime

September 30, 2026

Quick Overview of Work

The Spotify Group this week has decided to focus on the Recommendation System portion of the project. Our first plan of action was gathering literature on current recommendation systems for music, and to see which typical features are utilized. We want to find something unique to our own project, instead of mimicking the same recommendation systems that are already published. The literature was gathered, then uploaded to GitHub on September 24. After reading the literature individually, we proposed to come up with our own proposals on a recommendation system and meet to discuss which approach would be best. A summary of the research articles and key features was written and uploaded September 28 to GitHub, and an EDA (exploratory data analysis) is conducted on September 29, with another member creating slides (Sept 28) for their proposal on how we can create a unique recommendation system. Another member is beginning to create a Jupyter notebook for the basic recommendation system (Sept 30).

Current Project State

We are focusing on the preliminary data analysis to see the basic statistics for each feature. At the same time, we are creating a basic recommendation system following the structure of the literature. We want to first understand a "known" recommendation system before seeking our own improvements or interpretation of a recommendation system. Also, we have been researching more literature for music recommendation systems in search of more data sets to utilize in our project as well.
